

# Metis NLP Project

Did the COVID-19 pandemic shift the public perception of bats?

# INTRODUCTION

- Bats have been historically maligned (wrongly accused of being good for nothing blood-sucking, hair-grabbing, disease vectors)
- [Bat Conservation International](#) is dedicated to ending bat extinctions worldwide
- Interested in how COVID-19 pandemic affected public perception of bats
- Use findings to inform outreach and communication efforts and build support for bats and for their work

# DATA & DESIGN

- Used Twint to scrape >19,000 tweets from 2019-2022 containing the terms “bat” and “wildlife”
- Document-term matrix created from cleaned and lemmatized terms using scikit-learn’s CountVectorizer
- Non-negative matrix factorization to determine topics
- Vader sentiment analysis

Pre-Covid document count: 6,655; word count: 171,703  
 Post-Covid document count: 11,049; word count: 310,118

# SENTIMENT ANALYSIS

- Percentage of negative tweets about bats pre-Covid: **21.35%**
- Percentage of negative tweets about bats post-Covid: **26.05%**
- **4.7%** increase in percentage of negative tweets

J. SCOTT ALTENBACH

# TAKEAWAYS & RECOMMENDATIONS

- Focus on disease tapered off after initial spike  
(communication campaigns were effective)
- Threat of wind energy to bats receives less attention than habitat and disease issues  
(opportunity to tell this story more)
- Posts about bats remain positive overall but were more negative post-Covid (continue to monitor this trend)
- Future opportunity to analyze a wider array of tweets
